

Fundamentals & Setup and Web Application Deployment Using AWS

Cloud computing provides scalable, reliable and cost-effective hosting. This project explains creating an AWS account, understanding IaaS, PaaS and SaaS, creating an Amazon S3 bucket, uploading HTML, CSS and JavaScript files, enabling static website hosting and configuring bucket policy. The deployment continues by creating a CloudFront distribution, connecting a domain through Route 53, enabling HTTPS with AWS Certificate Manager, and testing global website access. Amazon S3 stores static files, CloudFront improves speed through caching, Route 53 manages DNS, and ACM provides SSL/TLS certificates. This architecture is secure, scalable, highly available and suitable for personal portfolios, documentation sites and business landing pages. Students learn the complete workflow from cloud fundamentals to deployment and gain practical experience with AWS services used in industry. The outcome is a publicly accessible static website with global content delivery and secure HTTPS access.
